A microbicidal solution for in vivo and in vitro treatment of microbial AB infections comprises an electrolyzed saline containing regulated amts. of ozone and active chlorine species wherein the ozone content is between about 5 to 100 mg/L and the active chlorine species content of between about 5 and 300 ppm. The active chlorine species comprises free chlorine, hypochlorous acid and the hypochlorite ion as measured by a chlorine selective electrode. The solution is prepared by subjecting a 1% or less saline to electrolysis under conditions sufficient to produce the desired active ingredients. The solution is preferably utilized at an isotonic saline concentration and may be adjusted with hypertonic saline. The solution may be used for the in vitro treatment of infected whole blood, blood cells or plasma to reduce contamination and is effective in treatment of fluids infected with HIV, hepatitis and other viral, bacterial and fungal agents. The solution may also be administered to warm blooded animals, including humans, by i.v. injection or other modes for similar purposes. If desired, neutralizing agents, such as antioxidants, may be administered in correlation with the solution

- AB Immunostimulant prepns. including active chlorine (1-1000 ppm) and antioxidants (SOD, myeloperoxidase, glutathione peroxidase, glutathione, catalase, ascorbate salts) are claimed as antimicrobials for treatment of bacterial and viral infections including HIV, hepatitis A, B, and C and AIDS. The active chlorine solns. were prepared, and their stability and in vitro toxicity and mutagenicity and in vivo toxicity and antiviral activity against HIV were tested.

A microbicidal solution for in vivo and in vitro treatment of microbial AB infections comprises an electrolyzed saline containing regulated amts. of ozone and active chlorine species wherein the ozone content is between about 5 to 100 mg/L and the active chlorine species content of between about 5 and 300 ppm. The active chlorine species comprises free chlorine, hypochlorous acid and the hypochlorite ion as measured by a chlorine selective electrode. solution is prepared by subjecting a 1% or less saline to electrolysis under conditions sufficient to produce the desired active ingredients. The solution is preferably utilized at an isotonic saline concentration and may be adjusted with hypertonic saline. The solution may be used for the in vitro treatment of infected whole blood, blood cells or plasma to reduce contamination and is effective in treatment of fluids infected with HIV, hepatitis and other viral, bacterial and fungal agents. The solution may also be administered to warm blooded animals, including humans, by i.v. injection or other modes for similar purposes. If desired, neutralizing agents, such as antioxidants, may be administered in correlation with the solution
